DMP Launches VK™ VMS, Enabling 24/7 Video Management With AlarmVision®

Launch expands Gateway family with new XV Plus Gateways

SPRINGFIELD, Mo. – DMP launched VK VMS, a new cloud-based, integrated video management solution that delivers live video viewing and on-site device management to DMP's flagship Virtual Keypad platform. The launch introduces AlarmVision subscription tiers and XV Plus Gateways, enabling professional monitoring in DMP's growing video platform.

Activated through the new XV Plus Gateway hardware, dealers can offer VK VMS independently of DMP's patented AlarmVision technology, which is now a suite of analytic subscriptions.

"We heard our dealers clearly," said Ken Francis, DMP Executive Vice President of Video Solutions. "They want more video management functionality and flexibility in how they deploy and quote AlarmVision. VK VMS and the new AlarmVision options are a direct response to that feedback."

By separating VK VMS from AlarmVision, dealers gain more affordable and flexible ways to build video systems specifically for monitoring. They can offer VK VMS for surveillance and video management, AlarmVision for intelligent detection, or combine them to add continuous recording to zone-linked events – allowing users to detect and classify activity, review footage and preserve video for future investigation.

DMP restructured its previous AlarmVision subscription into two new options: AlarmVision Plus and AlarmVision Pro. Dealers can match video intelligence and cost to an individual customer's need, while offering advanced features like Dynamic Slicing and contextual description.

"AlarmVision Plus is the natural next evolution of the award-winning AlarmVision technology," said Brad Tucker, Vice President of Product Management and Support at DMP. "Designed with VUE Plus Cameras in mind, the subscription allows cameras to serve as zones within the alarm system, enabling smart detection and scene awareness."

AlarmVision Pro builds on those capabilities with AI that understands activity in context, generates detailed event descriptions and allows users to search recorded video using natural language and specific attributes. For example, users can search for a person based on clothing, appearance, activity or location rather than manually reviewing hours of footage. Dynamic Slicing preserves full-resolution image detail for earlier, more accurate detection at greater distances.

The expanded Gateway family includes the XV Plus-20, XV Plus-80 and rackmounted XV Plus-80R. The XV Plus-20 supports up to 20 rated camera megapixels and includes 1 TB of video

storage. The XV Plus-80 and XV Plus-80R support up to 80 rated camera megapixels and include 4 TB of storage, with desktop and rackmount options available. All models simplify installation eliminating the need for inbound ports, port forwarding or a separate VPN appliance.

PRODUCT WILL BE AVAILABLE 9/24
