

# QUICK START GUIDE

## SecuraHub™

### 1. CHOOSE A LOCATION

The SecuraHub™ is designed to be placed on a tabletop or other flat surface. Choose a central location in the home to allow the hub to communicate clearly with sensors and keypads.

### 2. WPS THE ROUTER

If you are using a SecureCom Wireless Access Point (WAP), power it up now.

If you are working with another type of router, move on to Step 3 and then press the WPS button on the customer's router within 2 minutes of powering the hub.

If the router does not have a WPS button, move on to Step 3 and then connect a SecuraTouch™ keypad (a quick start guide is included with each keypad to guide you through the set-up process). Once the keypad is set up, follow the on-screen prompts to choose a network.

### 3. POWER IT UP

Plug the 12VDC power supply connector into the port on the back of the hub **A**.

Plug the other end of the power supply into a dedicated wall outlet not controlled by a switch **B**.
