

COMPREHENSIVE SECURITY FOR

Financial Institutions

Trusted by America's largest banks. Built for every bank.

Unified Security — One Platform, Total Control

A modern banking security strategy requires visibility and control across the entire enterprise. When you integrate into a single, panel-based platform:

INTRUSION

FIRE

ACCESS CONTROL

VIDEO

It simplifies management while supporting audit readiness and operational consistency.

By centralizing security functions, banks can standardize policies across locations, reduce manual oversight and gain clear insight into system activity.

Detailed audit trails, user monitoring and configurable schedules support accountability and compliance without disrupting daily operations.

Reducing risk. Strengthening accountability. Protecting every location.

Banks operate in an environment where security, compliance and operational efficiency must work together seamlessly. Across branches, administrative offices, ATMs and remote facilities, financial institutions face a complex mix of physical threats, operational risk and communication vulnerability — all while meeting strict regulatory expectations and maintaining customer trust.

Security today is more than intrusion detection. Financial institutions must protect people, assets and data while ensuring consistent standards across every site. The solution is a unified security platform designed specifically for financial institutions, built through ongoing collaboration with banking security, compliance and operations teams.

VISIBILITY AND CONTROL FROM ANYWHERE

Virtual Keypad™ gives bank managers and security teams a simple, secure way to monitor and control their systems from anywhere. Accessible from a smartphone, tablet or computer, the cloud-based platform allows authorized users to arm or disarm systems, check status, lock or unlock doors and receive real-time notifications from every connected branch or facility. Whether responding to an alarm event or confirming that a location closed properly, Virtual Keypad keeps critical system information within reach.

Designed for everyday banking operations, Virtual Keypad also streamlines user and credential management while providing visibility into system activity. Event notifications, system history and integrated video views help teams quickly verify incidents and respond with confidence. With support for multiple locations under a single login, banks can maintain consistent security oversight across branches without adding complexity to daily operations.

Built for Banking Operations

At the foundation is the **XR550 control panel** — a flagship platform designed for financial institutions that require more than basic intrusion protection. Built to support daily operations and **proactive risk management**, XR550 helps banks maintain accountability and identify potential issues before they escalate.

MANAGE USERS, LOCATIONS AND WORKFLOWS

Standardized Profiles
Permission Management
Scheduling Tools

DESIGNED FOR HIGH SECURITY ENVIRONMENTS

Supports UL, Bank, Safe & Vault
Applications
Card Plus PIN
Dual Authority
Early Morning Ambush

PROACTIVE RISK MANAGEMENT

User Inactivity Audits
Inactive Zone Monitoring
Late to Open or Early to Close

SECURE COMMUNICATIONS AND FASTER VERIFICATION

Reliable, secure communications are critical for banking environments. VAULT creates private, encrypted panel communications that never touch the public internet, reducing cyber exposure and supporting data protection goals.

For faster, more accurate response, AlarmVision transforms existing cameras into analytics-driven detection tools that trigger real panel alarms based on real activity — helping reduce false alarms and associated costs.

BUILT FOR RISK REDUCTION AND RESILIENCE

The right solution helps financial institutions establish a consistent security standard across every branch, ATM and remote site. By combining unified control, secure communications, faster verification and proactive monitoring, banks gain stronger protection, clearer accountability and greater operational confidence — all on one platform.

One standard.
One system. Every location.

Expand Protection with Targeted Add-On Solutions

Banks face more than traditional intrusion risk. Layered protection helps address communication threats, evolving access needs and non-criminal disruptions that can still create major operational impact.

Add-on solutions extend protection across critical risk areas:

JamAlert

Detects unusual interference in wireless signal traffic and triggers real-time alerts through the panel to the monitoring center. Early awareness helps identify jamming attempts before communication is compromised and allows flexible responses such as local alerts or automated actions.

Digital Key Credentials

Modernize access with secure, contactless credentials stored in a mobile wallet. Digital Key supports encrypted credential delivery, native device security and easy lifecycle management — allowing institutions to issue, revoke or update access quickly without physical cards.

1112 Water and Temperature Detector

Monitors for water leaks and temperature extremes in IT closets, server rooms and utility spaces. Early detection helps prevent costly downtime, equipment damage and service disruption caused by leaks, freezing or overheating.

Layered protection that adapts to banking risk — without adding complexity.
