Benefits for You

All wireless systems allow for easy, flexible installation options.

The network communication for Wi-Fi is free.

No NOC gives your customers constant signal transmission.

Save time with Two-Way wireless. Install a system with only one technician.

Distributed Components Offer Stronger Security Than Traditional All-in-One Systems

Installing the panel, keypad and siren in separate parts of the home makes the system less vulnerable to tampering. If intruders try to damage the keypad, the control panel continues sending signals to the monitoring center.

Reduce False Alarms With the Quick Response Question

In an alarm event, you would enter your code to silence the siren. Every other system in the world will disarm, silence and send a cancel signal to the monitoring center. Not with DMP. The False Alarm Question allows you time to decide if this is a real emergency.

High Visibility Alert Feature

During an alarm state, the keypad screen turns red. It remains red until the system is reset, providing a visual warning of potential danger to anyone entering the building.

Wireless Stability

Wireless signals can't be jammed or hacked due to 900 MHz frequency-hopping-spread-spectrum technology.
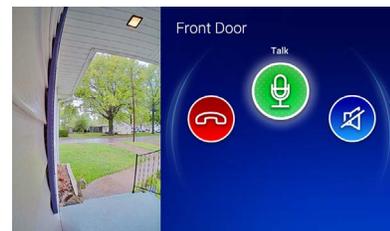

Event Verification Dashboard

Verify who armed or disarmed the system by capturing snapshots of all arming and disarming events.

Visual Verification With Video Doorbell

View live and recorded video. Speak to guests or delivery drivers through the video doorbell, all from the keypad.

Easily Arm/Disarm Areas From One Screen

From one screen, you can quickly see the arming status of all areas and arm and disarm each one individually.
