

TECHNICAL UPDATE | JANUARY 2026

New Features

Firmware Version 755 (1/21/26) is now available for XR INT Series control panels. **Panels with this firmware are directed to servers in the EU to ensure compliance with General Data Protection Regulation (GDPR).**

With the release of this update, XR INT Series panels can only be accessed from Dealer Admin Global (dealer.eu.securecomwireless.com).

XR150INT/XR550INT

With this update, XR INT Series panels now include the following features:

Panel Serial Number in Serial 3 Messages

Enable Serial 3 messages to include the panel serial number. If enabled, the panel family and corresponding serial number appear at the end of each Serial 3 message, allowing the monitoring center to identify the correct system if two panels unintentionally use the same account numbers.

This update requires an SCS-VR Virtual Receiver.

Zone Location

This update allows you to assign zones an optional secondary name to give further clarification on the location of a zone. Zone Location provides the monitoring center additional support and promotes quicker response times from monitoring center operators and first responders. The secondary name is only visible to the monitoring center and does not display on the keypad.

OSDP Support

This update allows XR Series Control Panels to receive and send OSDP commands to [734INT Access Control Modules with firmware Version 108](#).

New reader LED actions can be configured in [Entré Version 9.8.2 \(9/4/25\)](#) or in Dealer Admin.

Door Schedules

This update allows **Door Schedules** to operate correctly when only a start time or only an end time is entered.

Mult-Swipe Custom Actions

Multi-swipe options have been added to **Custom Actions** in Virtual Keypad and are now supported on XR Series Control Panels. Custom swipe actions can be enabled to allow users to **Swipe Twice** or **Swipe Three Times** to arm one area or a group of areas, unlock a door or a group of doors, initiate a Lockdown, or activate Favorites, Lights, and Outputs.

Bell Circuit

This update improves bell circuit monitoring to confirm the panel bell is only active during alarm conditions.

Usability Improvements

Z-Wave Improvements

This update allows the 738Z+ to return to its default state for quicker adding, editing, and deleting of Z-Wave devices and actions.

Public Access Doors

Previously, when a public access door was toggled unlocked by an output group, it was not included in the lockdown, even when marked as a public door. Now, public access doors are included in the lockdown regardless of if it is part of an output group.

Improved Communication

Systems communicating with Dealer Admin send messages regardless if they have a communication path programmed, allowing for push notifications and analytics in Dealer Admin and Virtual Keypad.

Exit Delay Restart

Previously, the **Exit Delay** restart feature was enabled when **Occupied Premises** was set to **YES** and disabled when **Occupied Premises** was set to **NO**. Now, **Exit Delay** restart is always enabled.

Chime Improvements

This update improves the panel chime to properly sound when triggered.

Obtaining the New Firmware

The newest update is available for download, free of charge, on Dealer Admin Global (dealer.eu.securecomwireless.com).
